

Dear Editors,

We thank the Editors for the opportunity to transfer our manuscript, “*How Focused Are LLMs? A Quantitative Study via Repetitive Deterministic Prediction Tasks*” (manuscript XQ11175), to *Physical Review Research*, and we are grateful to both Referees for their careful and constructive reports. We have revised the manuscript to address every point raised. No new experiments were required: all strengthening derives from re-analysis of the already-collected data and from clearer framing.

The principal changes are:

- every accuracy-versus-length curve now reports explicit sample sizes (up to $n = 100$ instances per length) with 95% confidence intervals;
- the Sherrington–Kirkpatrick mapping is now presented as an *effective, phenomenological* model that reproduces the observed crossover and yields a compact two-parameter diagnostic, with earlier first-principles claims about attention removed;
- we reconcile the perturbative expansion and the double-exponential law, correcting a coefficient in the large-field reduction and stating explicitly that the closed form is a phenomenological approximation valid for small J_0 and large h , not a strict term-by-term resummation; and
- we add a scaling-collapse figure that directly tests and confirms the universal finite-size crossover predicted by the model.

A point-by-point response to both Referees and an itemized list of changes accompany this resubmission, together with a change-marked version of the manuscript.

We believe the revised manuscript is well matched to the scope and criteria of *Physical Review Research*, and we thank the Editors and Referees again for their time.

Sincerely,
The Authors
